ATLAS

The store operating system for independent and multi-location retail

One login · One ledger · One source of truth
POS · Inventory · Staffing · Analytics — modular and multi-branch by design

Investor Pitch · 2026

Confidential

1. The Problem

Independent and small-chain retailers still run on a patchwork of disconnected tools: a POS, a separate inventory app, a scheduling tool, a spreadsheet, and a bookkeeping package. None share a data model. Stock counts drift, reordering is reactive, cash is reconciled by hand, and the owner of two or more locations has no single screen that tells the truth across branches.

The result: hours spent reconciling numbers that should already agree, stockouts discovered after the sale is lost, and zero ability to answer “How much did Lekki make yesterday at what margin?” without phoning someone.

This is a stock-and-cash control problem first. Staff need a faster till. Owners need numbers that were true five seconds ago — across every branch — without asking anyone.

2. Market Opportunity

Segment	2025	Forecast	CAGR
Retail management software (global)	$24.97B	$46.5B by 2030	13.2%
POS software (global)	$16.05B	$32.33B by 2031	12.4%
Retail SaaS (NA largest sub-segment)	—	$17B by 2030	—

SMBs and independents are the largest underserved segment. 46% of small businesses planned to replace or upgrade POS software in the most recent survey year. Cloud/mobile-native is what is pulling them off legacy systems. North America is the largest region; Asia-Pacific the fastest-growing.

SOM (initial wedge): Independent and small-chain retailers (1–20 locations) in food & beverage, apparel, and specialty retail — large enough to reach $50–100M ARR without an enterprise logo.

3. Solution — Atlas

Atlas is a single operating system for physical retail. POS, inventory, staffing, and analytics share one data model and one ledger. An inventory count, a labor hour, and a sale are the same kind of object in the same database — which is what makes the reconciliation problem disappear rather than get automated.

- **POS & Payments** — Fast checkout, offline mode, split tender, embedded payments (revenue line, not just a feature).
- **Inventory & Supply** — Real-time stock per location, low-stock alerts, transfers, receiving, adjustments with mandatory reason.
- **Staffing** — Scheduling, clock-in/out, labor-cost-to-sales in real time.
- **Analytics** — One dashboard for margin, shrink, sell-through, multi-store comparison, demand signals.
- **Modular & Multi-branch** — Tenant Admin sees every store; Store Managers are scoped; modules toggle on without a second product.

4. Why Atlas Wins

Most store-management pitches are feature lists. Atlas's edge is structural.

1. Vertical integration as the moat. Own hardware, software, and payment rails where it matters. Incumbents certify third-party terminals and route payments through partners. Owning the stack removes vendor tax at every layer and lets iteration speed compound inside one company.

2. Radical simplicity. A store owner should be fully operational in under 15 minutes, with zero training video and zero onboarding call. If a feature needs a support ticket to explain, it is not finished.

3. Wedge-to-platform sequence. Launch as the best POS + inventory for a narrow vertical, prove unit economics, then expand modules and locations. Small, defensible beachhead that funds the platform play.

4. Multi-branch native. Not a single-store product with a "multi-location add-on." Tenant → Stores hierarchy, role scope, inter-store transfers, and consolidated reporting are first-class from day one.

5. Product Snapshot

Organizational model: Tenant (business) owns many Stores (branches). Tenant Admin sees all stores and consolidated numbers. Store Manager sees only assigned branches. Cashier is scoped to the active store/shift. Modules (Staffing, Purchasing, Advanced Analytics, Serial/Batch, Recipes) enable per tenant without forking the codebase.

Time to first sale: Target under 15 minutes from signup. **Checkout latency:** under 200 ms online. **Offline:** full checkout with durable queue and idempotent sync.

6. Business Model

- **SaaS subscription** — Tiered by location count and module access (Starter / Growth / Multi-Location).
- **Payments take rate** — Embedded processing on every card/transfer transaction; largest revenue line at scale.
- **Hardware** — Terminal + drawer + scanner sold near cost as acquisition and lock-in; margin lives in software and payments.
- **Future financial services** — Working-capital and inventory advances underwritten on first-party sales and stock data Atlas already holds.

Each additional module or location raises switching cost without a new go-to-market motion — same login, same data model. Expansion revenue behaves like a feature launch.

7. Competitive Landscape

	Atlas	Square	Shopify POS	Lightspeed
Hardware	Owned / opinionated	Owned	3rd-party certified	3rd-party certified
Payments	Owned	Owned	Owned (Shopify)	Partnered
Inventory + staffing in core	Yes, day one	Add-on	Add-on / apps	Add-on
Multi-branch native	Yes	Partial	Partial	Stronger mid-market
Time to first sale	Under 15 min	~1 hr	1–2 hrs	Days (setup-heavy)
Target	Independent & small chain	Micro / broad SMB	E-comm first	Mid-market multi-location

Atlas does not try to be "Square but cheaper." It is the full-stack, multi-branch operating system that independents and small chains can actually set up and trust.

8. Go-to-Market

• **Beachhead:** One or two verticals that are genuinely different (e.g. specialty retail + food & beverage) so the product model is proven under real variance.
• **Motion:** Founder-led and product-led; time-to-value under 15 minutes is the primary acquisition lever.
• **Expansion:** Land with POS + inventory; expand to staffing, multi-location, and payments take rate.
• **Geography:** Domestic beachhead first; Asia-Pacific as natural second region given growth rates and retail density.

9. Roadmap & Milestones

Phase	Scope	Success Signal
V1	POS + payments + inventory, single location, offline	Time-to-first-sale < 15 min; no oversell under load
V2	Multi-store, Tenant Admin views, staffing, transfers	Pilot multi-location tenants live; support tickets low
V3	Advanced analytics, purchasing, module marketplace / API	NRR > 100%; expansion from modules + locations

10. The Ask

We are raising **$[Seed / Series A amount]** to convert a working pilot into a category-defining platform.

Allocation	Share	Purpose
Engineering	40%	Core platform, multi-branch hardening, payments infrastructure, hardware path
Go-to-market	25%	Founder-led sales, first vertical rollout, content & product-led loops
Hardware unit economics	15%	Initial inventory, manufacturing partner setup
Compliance & payments licensing	10%	PCI scope, money-transmission where required
Operating buffer	10%	Runway extension

Runway target: 18–24 months to Phase 2 milestones (multi-location pilots live, repeatable acquisition, clear path to NRR expansion).

11. Closing Vision

Every category-defining hardware-and-software company of the last two decades won by refusing the easy version of the problem. Atlas makes the same refusal in retail infrastructure — not integrating with the existing mess of POS, inventory, and payment vendors, but replacing it with one system, owned end to end, modular enough for a single boutique and powerful enough for a 20-store chain.

The market is growing at double-digit rates into a pool that nearly doubles by 2030. The SMB and independent segment is still running on tools designed for a pre-cloud retailer. The company that wins will look less like another SaaS dashboard and more like the store's actual operating system.

Atlas — One login. One ledger. Every branch.
